<pre>String p = "pancakes";</pre>	ĺ		
<pre>out.print(p.length());</pre>	// LINE 1	1.	
<pre>out.print(p.charAt(1));</pre>	// LINE 2	2,	
<pre>out.print(p.compareTo("pear"));</pre>	// LINE 3	3.	
out.print(p.substring(3,7));	// LINE 4	4.	
out.print(p.indexOf("ak"));	// LINE 5	5	

Write a method called bothEven() that takes in two whole numbers then determines if both numbers are even. If both numbers are even the method returns a 1, if only one number is even it will return a 0, and if neither is even the method returns a -1.

Example: bothEven(12,13) would return a 0, and bothEven(32,18) would return a 1

Write a method called firstChar(). This method will take in one String variable as a parameter and return the first character of the given string.

Example: firstChar("summer") would return an 's', and firstChar("break") would return a 'b'
